# Facts about Titanic

- Massive hull, measuring 882 x 92 feet; damaged by a gash that was only 220 x 245 inches long
- The gash flooded 5 watertight compartments; had it been only 4, the ship would have stayed afloat
- It took (number of years) to build, but only 3 hours for the famous ocean liner to sink completely
- Sunk because it collided with a small iceberg, about 400 miles off the coast of Canada

# Facts about Titanic

- A total of 6 iceberg warnings were ignored during the course of that fateful night on April 14, 1912
- the ship was travelling at 22.5 knots (that's just 0.5 knots off its max speed of 23knots); too fast for safety
- there were a total of 1178 lifeboat seats available; however many left the ship only half full
- only 705 passengers survived; 1503 perished
- most of the survivors were women and children
- The wealthy and powerful perished together with the poor and powerless workers

# LESSONS

- Never too important to go under
- That one safety valve could be the difference
- It takes ages to build, but only a moment to destroy
- Our undoing might not be about size but the hit
- The signals we ignore may come to haunt us
- Pace of reckless debt procurement could be our undoing
- Our well laid out plans will unravel in chaos
- It matters little where you sit/stand in a sinking ship
- Even the finest of us is not safe when the water breaks the hull
